

MIGUEL ANGEL BRISEÑO FLORES

DEVOPS ENGINEER 

Guadalajara, Mexico 
miiguelb07@gmail.com 
[LinkedIn](#) 
+52 331-529-7653 

PROFILE

DevOps Engineer with experience in CI/CD Tools, Kubernetes, Containerization, Ansible, and Cloud Services. Passionate about solving tasks with a background related to automation, shining in developing automated environments such as pipelines and deployments. My most notable skills are the total autonomy and independence to complete tasks, in addition to my creativity and love of teaching to share solutions with friends and colleagues.

LANGUAGES

English C1
Spanish Native

EDUCATION

Tecnologico de Monterrey (ITESM)
Bachelor in Mechatronics Engineer

SKILLS

- **CI/CD Tools:** GitLab CI/CD, GitHub Actions
- **Orchestration Tools:** Kubernetes (K8s, k3s)
- **Package Managers:** Helm Charts
- **Programming languages:** Python
- **Scripting Languages:** Bash, Python
- **Containerization Technologies:** Docker, Docker-Compose, Kubernetes, Containerd
- **Cloud Computing Platforms:** AWS, GCP, DigitalOcean
- **Monitoring and Logging Tools:** Prometheus, Grafana
- **Version Control Systems:** Git, ADE
- **Infrastructure-as-code tools:** Terraform
- **Configuration Tools:** Ansible
- **Databases:** MongoDB

CERTIFICATES

Amazon Web Services

AWS Certified Cloud Practitioner

IELTS

IELTS (C1)

January 2024 - Present

Oracle

Site Reliability Developer

Internal Applications

January 2024 – March 2026

In this project I have been helping with support to the team with maintenance of the servers, improving stability and reliability of the servers running the applications. Also in proposing new tools and improving the security of basic parts of the servers. More recently I have worked in development of one of the applications and support in Perl.

Skills:

- Creating scripts and improving existing
- Supporting every team member as possible
- Creating pipelines in Gitlab
- Improving server stability
- Developing playbooks for the team inventory in Ansible
- Creating recovery plans for the services
- Maintenance to services and servers
- Fixing vulnerabilities in the machines
- Creating Scripts for maintenance

Technologies:

- Git
- GitLab
- Bash
- WebLogic
- Ansible
- Apex
- Python
- Oracle Cloud Infrastructure
- ADE (VSC as Git)

October 2023 - February 2024

Servicios Veterinarios Eläin

Software Development Lead

Business Website, Guadalajara

October 2023 – February 2024

During this project, I served as the lead engineer responsible for project design, structuring, planning, and product delivery. I worked alongside a frontend apprentice, teaching them how to work under Agile methodologies, demonstrating Git management, and maintaining a well-organized workflow with branches and tickets.

In addition to these responsibilities, I managed the infrastructure on Google Cloud Platform (GCP), handled network management, and developed pipelines for automating the development environment with GitHub Actions. I was also involved in bug fixing, Docker containerization, direct client interaction, and the full deployment of the application.

Skills:

- Project Management
- Teaching and Mentoring
- Agile Methodologies
- Collaboration
- Bug Fixing
- Client Interaction

Technologies:

- GitHub Actions
- Docker
- GCP
- NodeJs
- React
- HTML5
- Git
- Nginx

EXPERIENCE

December 2022 - January 2024

Grid Dynamics

Junior DevOps Engineer

DevOps Project 1, Guadalajara

June 2023 – December 2023

In this project I have carried out many activities: Configure the local kubernetes cluster, configure the network connections and configurations of the deployed services, deploy and set up services such as Nexus 3, Replica Set for MongoDB, SonarQube service, Prometheus, Grafana, gitlab-runners, deployments of frontend and backend applications. Initially the infrastructure was built in GCP, I used services such as Cloud Run, and more types of serverless services to reduce costs, then I had to migrate the database and all the services to the local Kubernetes cluster. Additionally, create all pipelines from scratch for: frontend in Javascript, backend in Python, android in Kotlin and iOS in xcode.

Responsibilities:

- Create and maintain pipelines for the repositories in GitLab CI/CD:
 - Frontend (Javascript/React)
 - Backend (Python)
 - Android (Kotlin)
 - iOS (xCode)
- Create and maintain the different tools and services for internal projects using helm charts:
 - Nexus 3
 - SonarQube
 - MongoDB
 - Prometheus
 - Grafana
- Participating in scrum meetings
- Create gitlab-runners for the CI/CD, they were deployed using helm charts
- Configure and implement additional features to the different services
- Create a fully automated workflow for the project
- Design the team branch strategy
- Create a versioning system for the artifacts built in the project
- Help and share knowledge with my colleagues of every part of the team
- Help the backend with changes in the infrastructure and petitions
- Propose new technologies and tools that can help the project and the team
- Troubleshoot all the services, applications, pipelines and processes that had issues
- Create some Chaos experiments for the cluster

Technologies:

- Kubernetes (k3s), Helm, Traefik
- LitmusChaos
- GitLab CI/CD
- GCP, DigitalOcean, Serverless Services
- Docker
- Bash
- Python
- Networking, Ingress
- Terraform
- Git
- Nginx
- Monitoring

December 2022 - January 2024

Grid Dynamics

Junior DevOps Engineer

DevOps Project 2, Guadalajara

August 2023 – January 2024

During this project I have reused tools that I have deployed in another project to create the infrastructure and deploy resources. Among the things I have done is make a multistage image for the Python app, completely create the pipeline and then a Cronjob to deploy the project's python script. In addition to sending the built images to the Nexus 3 repository that I have in the local cluster, using versioning for each image.

Responsibilities:

- Create multistage image of the python script
- Create the pipeline for the repository
- Create a branch strategy for the project
- Deploy built images to the Nexus 3 repository
- Create a Cronjob for the Kubernetes deployment of the application
- Automatize the project

Technologies:

- GitLab CI/CD
- Kubernetes, Helm, Cronjob
- Docker
- Scripting
- Networking
- Git

DevOps Project 3, Guadalajara

June 2023 – August 2023

During this internal project, my tasks were to create the pipeline for the web application written in javascript react. Create GitLab Runners for the entire project, build the JFrog Repository for the artifacts, and plan infrastructure for AWS. My first learning that I consider relevant was developing my social skills to be able to communicate with the developers and make the project work. After this project, the other internal projects I got involved in were much simpler to start working on. Also as part of the tests before making changes to infrastructure or related to services, I raised test development instances and environments in DigitalOcean.

Responsibilities:

- Create GitLab Runners
- Develop the complete pipeline for the web application
- Set up the kubernetes services for the project such as:
 - JFrog Repository
 - Jenkins Server
- Raise tickets to request permissions and request certain resources for the project
- Participating in scrum meetings
- Create documentation related to the project
- Designing and organizing an agenda of activities that the team and I will be working on
- Developing an action plan to build infrastructure on AWS

Technologies:

- GitLab CI/CD
- Jenkins
- Bash, SSH
- JFrog
- Terraform, DigitalOcean
- AWS
- Javascript
- Docker
- OpenVPN
- Git

Apprenticeship, Guadalajara

January 2018 – November 2018

During my internship at Assetel, I worked alongside a team of cloud engineers in the server department. The servers I handled and learned about were primarily Windows, and for the first time, I managed a Linux server. Among my responsibilities were assisting the lead engineer with tasks such as troubleshooting some servers, remote monitoring, and occasionally visiting the company's data center to ensure everything was in order. I also assisted various office departments such as accounting, finance, etc., with their computer equipment and the office network.

One of my most notable tasks was automating some of the engineers' duties. One of them involved creating a script to process logs and verify the status of specific servers that were requested of me.

PROJECTS

Webpages, Self-Hosted

May 2023 – August 2023

Self-hosted web servers

In this project I created two simple webpages with javascript, created a CI/CD workflow, stored artifacts in self-hosted Nexus repository, and deployed the projects with Nginx in linux machines.

Technologies:

- Javascript
- Jenkins
- Nexus 3
- Linux CentOS
- Nginx
- Git
- Raspberry Pi

Unity 2D Game, Self-Hosted

April 2023 – June 2023

I created a simple and funny 2D videogame with Unity 3D engine in C#, for the CI/CD pipeline I used GitHub Actions, Nexus 3 Repository for artifacts, and Nginx to deploy the game in linux machines.

Technologies:

- C#
- Nexus 3
- Linux CentOS
- Nginx
- Git
- Raspberry Pi
- GitHub Actions

VOLUNTEER WORK AND INTERESTS

Volunteer at a Farm

I gained a unique perspective on sustainable farming, animal welfare, and community engagement while caring for animals and assisting on a farm in Finland.

Autism Support Volunteer

Helped children develop social, communicative, and cognitive skills through interactive play, stimulation exercises, and sensory activities.
